

10-MINUTE JOB DESCRIPTION (JD) TAILORING WORKSHEET

FREE MVP v0.1TACTICAL WORKSHEET

How to Reverse-Engineer a Fresher Job Posting & Align Genuine Project Experience Without Fabricating Skills

**STEP 1 (3 Mins)**  
**Scan & Extract**  
Underline 3 Hard Technical Skills, 2 Developer Tools, and 1 Core CS Fundamental from the JD requirements.

**STEP 2 (2 Mins)**  
**Truthful Audit**  
Cross-reference with your actual projects. Do you have genuine code evidence? If yes, proceed. If no, never fake it.

**STEP 3 (3 Mins)**  
**Align Phrasing**  
Adopt the exact standard technical phrasing used in the JD (e.g. change "API creation" to "RESTful API Development").

**STEP 4 (2 Mins)**  
**Reorder Bullets**  
Place your most relevant project at the top and ensure the first bullet point directly highlights the required stack.

PRACTICAL DEMONSTRATION WALKTHROUGH

**FICTIONAL DEMONSTRATION EXAMPLE — DO NOT COPY DIRECTLY:**  
**Target Job Posting Requires:** "Strong understanding of Python, RESTful API architecture, relational database queries (SQL), and automated testing."  
**Candidate's Actual Experience:** Built a college task manager project using Python (FastAPI), SQLite, and tested endpoints with PyTest.  
**Before Tailoring:** "Made a backend task manager website using Python and SQLite database."  
**After Tailoring:** "Engineered RESTful API service with FastAPI and relational SQLite schema; authored 20+ automated unit tests in PyTest covering all CRUD endpoints." (100% truthful, perfectly aligned).

WORKSHEET: JOB ALIGNMENT MATRIX (FILL FOR TARGET ROLE)

| JD Term / Requirement          | My Truthful Experience / Project Evidence             | Updated Resume Phrasing                                        | Interview Defense Talking Point                                   |
|--------------------------------|-------------------------------------------------------|----------------------------------------------------------------|-------------------------------------------------------------------|
| Example: RESTful APIs & SQL    | Built FastAPI backend with SQLite in Capstone project | Engineered RESTful endpoints in FastAPI with relational schema | Can explain HTTP methods, status codes, query joins, and indexing |
| 1. Primary Hard Skill:         |                                                       |                                                                |                                                                   |
| 2. Secondary Tool / Framework: |                                                       |                                                                |                                                                   |
| 3. Database / Infrastructure:  |                                                       |                                                                |                                                                   |
| 4. Core CS Concept / Testing:  |                                                       |                                                                |                                                                   |

**NON-NEGOTIABLE ETHICAL BOUNDARY:** Tailoring means highlighting and translating your *genuine capabilities* into the vocabulary used by the recruiter. Never add technologies you have never installed, never written code for, or cannot defend under scrutiny. Disqualification during an interview screen damages your reputation and wastes your time.
